Does Land Inequality Magnify Climate Change Effects? Evidence from France

> **Ignacio Flores** (PSE) Dylan Glover (INSEAD)

October 31st 2023 Paris School of Economics

Flores and Glover (2023)

Inequality and Climate Change

Harvesting the consequences of climate change

Note. Heatwaves threaten global food security and price-stability. Al-generated image with Stable Diffusion

Flores and Glover (2023)

• **Historical:** Have land-consolidation patterns affected resilience to climate change in modern agriculture?

• **Policy:** Can we improve the resilience of our agricultural systems facing climate change?

A story of land inequality and crop diversity

Our contribution

- o We show at canton level, in France
 - + land inequality ightarrow crop diversity
 - Heatwaves cause greater loss in more concentrated land
- o We uncover a trade-off for farmers and policy makers
 - Concentrated systems: more productive but fragile
 - Diverse systems: less productive but resilient

Related literature (1/2)

Climate change on agricultural productivity

- Negative impacts on productivity: extreme weather events (Lobell and Field, 2007; Schlenker and Roberts, 2009).
 Compound shocks (Haqiqi et al., 2021). Overall production (Dell, Jones, and Olken, 2012)
- Positive impacts on productivity: the CO_2 fertilisation effect (Taylor and Schlenker, 2021)
- Long term predictions and technological adaptantions: Predictions (Mendelsohn, Nordhaus, and Shaw, 1994; Schlenker, Michael Hanemann, and Fisher, 2005; Burke and Emerick, 2016).
- o Techonolgical adaptations (Moscona and Sastry, 2022)

・ロト ・聞ト ・ヨト ・ヨトー

Related literature (2/2)

Farms consolidation and productivity

 Convergence towards higher farmland consolidation with development (due to increased labour productivity) (Eastwood, Lipton, and Newell, 2010; Frankema, 2010; Adamopoulos and Restuccia, 2014; Lowder, Sánchez, and Bertini, 2021). Explains most of cross-country differences in productivity levels, average farm sizes, and in farmland distributions.

Biology literature

 Strong links and clear mechanisms between diversity and resilience in both natural and agricultural ecosystems (Cadotte, Cardinale, and Oakley, 2008; Kremen and Miles, 2012; Duffy, Godwin, and Cardinale, 2017; Renard and Tilman, 2019).

Flores and Glover (2023)

Can we convert GPP into yield?

Possible in theory, but not enough information at our scale

Table: GPP to Yield conversion factors, examples

Factor
0.55
0.42
0.44
0.22
0.28
0.24
0.35

Notes. By He et al. (2018) for annual yield of staple crops in Montana, USA

Values are proportional to yield and we can control by composition

Measurements from the sky: temperatures (${}^{\circ}C$)

Figure: Monthly average temperature, at 5.6km resolution, summer 2021

A ID > A ID > A

Flores and Glover (2023)

Temperature shocks

3

イロト イヨト イヨト イヨト

Temperature and productivity: non-linearity

- More light is beneficial for plants in normal times (photosynthesis), but there are limits
- Schlenker and Roberts, 2009 find a nonlinear relation with crop-dependent turning points: corn ($29^{\circ}C$), soybean ($30^{\circ}C$) and cotton ($32^{\circ}C$) in the US.

Temperature and productivity: France

Figure: Monthly productivity vs. temperature (2000-2021)

Notes. Binned scatter plot in centiles of observations, no controls. Using Running and Zhao, 2019, Wan, Hook, and Hulley, 2021, and French cantons

Year-long consequences of extreme heat

Figure: Agricultural production in normal vs. shock year, 2000-2021

イロト イポト イヨト イヨト

Heat tolerance is crop-cycle specific

Table: Critical temperatures by crop in spring/summer

Crop	Max. temp (${}^{\underline{o}}C$)	Land share	Cumulative	Reference
Winter wheat	32	34.5	34.5	Gammans et al. (2017)
Corn/Maize	32	17.4	51.9	Hawkins et al. (2013)
Winter barley	33	7.4	59.3	Gammans et al. (2017)
Rapeseed	27	6.1	65.4	Pollowick and Sawhney (1988)
Sunflower	35	4.3	69.8	Rondanini et al. (2003)
Grapevine	30	3.6	73.3	Imputed
Spring barley	32	3.3	76.6	Gammans et al. (2017)
Alfalfa	30	2.8	79.5	Murata et al. (1965)
Beetroot	30	2.6	82.1	Imputed
Potato	30	1.1	83.2	Imputed
Soybean	30	1.0	84.1	Schlenker and Roberts (2009)
Spring wheat	33	0.2	84.3	Gammans et al. (2017)
Other (<1%)	30	15.6	100.0	Imputed

Note. Compiled by the authors

Defining a threshold for heatwaves

• Critical temperature for treatment in canton c for year t is

$$T_{c,t} = \sum_{i=1}^{N} T_i * A_{i,c,t}$$

• The average critical temperature of crop $i(T_i)$ weighted by its land share $(A_{i,c,t})$.

Measurements from the land: main variables

Cantonal Land Inequality:

- o Uses georeferenced information on farm borders
- o Farm level \neq owner level

Cantonal crop diversity:

- o Data on crop-mixes within farm borders
- o Crop level, independent of ownership
- o Broader categories (28) or detailed (+150)

...which are highly correlated (-)

Figure: Diversity vs. Gini (Binned scatterplot)

Notes. Own estimates based on French Cadastral data. Cantons with less than 10% of agricultural area are ignored

Map of Gini coefficients, latest year

Flores and Glover (2023)

24 / 55

Crop diversity (n^{o} of species), latest year

Identification

3

イロン 不聞と 不同と 不同と

Two faces of the same coin?

- o Rational incentives towards specialisation and land consolidation
- Plants do not farm themselves: land distribution is the political economy of the problem
- Biodiversity has a well studied causal effect on resilience of natural and experimental ecosystems

Basic weather shock specification

• Effect of extreme weather shock with leads and lags to account for correlation in temperatures over months

$$ln(GPP_{ct}) = \gamma_c + \lambda_t + \sum_{\tau=0}^{3} \beta_{-\tau} \times D_{c,t-\tau} + \sum_{\tau=1}^{3} \beta_{\tau} \times D_{s,t+\tau} + \epsilon_{c,t}$$
(1)

- $D_{c,t} = 1$ if there is a temperature shock in canton c in month t
- γ_c, λ_t canton and time fixed effects
- Compare impact over quantiles of land Gini and crop diversity

Stationary impact on monthly productivity-flows

Figure: What cantons suffer more losses?

< 行い

Heterogeneous impacts on monthly productivity

Figure: What cantons suffer more losses?

(日) (周) (日) (日)

.. what about yearly cumulative production?

Figure: What cantons perform better under heat shocks?

∃ >

Can we de-trend estimates?

3

< ロ > < 同 > < 回 > < 回 > < 回 > <

Hourly temperature data (Météo France)

- We de-trend estimates using data from public weather stations
- We **interpolate** average afternoon temps with most simple function (inverse-distance weighting)

Flores and Glover (2023)

Ranking of magnitudes holds with new data on temps.

(日) (周) (日) (日)

Dynamic impact on production flows, by Gini fractiles

 After the shock, lower productivity is observed for many periods suggesting structural damages. Estimates are de-trended using canton-month interactions

Flores and Glover (2023)

Cumulative production (by Gini fractiles)

weighted shock, type: foods absorb(canton##i.month i.t)

• The most unequal third of cantons suffer more with lasting consequences for yearly production (relative to 1st third)

Flores and Glover (2023)

Temperature shock on

Studying more granular flows (SD of logs)

absorb(canton##i.month i.t)

• The standard deviation of logs provides an even cleaner identification, as an inequality index, it weights more transfers to the lower end of the distribution (Atkinson, 1970).

Flores and Glover (2023)

Cumulative production (SD of logs)

weighted shock, type: foods absorb(canton##i.month i.t)

Flores and Glover (2023)

Temperature shock on Cumulated production, C.kg/m²

Inequality and Climate Change

Robustness checks and discussion

What we have done:

- o Drop everything that is not food ($\approx 40\%$ sample)
- o Several shock-thresholds (25, 27, 33, and 35 Celsius)
- Other definitions of diversity (Hirschman-Herfindahl index) and inequality (coefficient of variation, s.d. of logs)
- o Weighted shocks
- o Finer temperature data
- Can inequality/diversity be endogenous? We restrict ranking as in initial periods.

Steps forward and further questions:

- o What particular crop-mixes perform better?
- o Is this a portfolio effect or a symbiotic one?

Concluding remarks

- o Land concentration seems to matter for resilience to heatwaves
- The mechanism is likely related to crop diversity (policy oportunity?)
- Several questions remain open: Portfolio effects? Symbiotic effects? Behavioral?
